

BITCOIN SKY WHITEPAPER

Overview

Bitcoin is the most popular cryptocurrency. Since Bitcoin blockchain grew every year, some issues arise. Block generation time of Bitcoin is slow, about 10 minutes per block. Bitcoin has scalability problem that can only proceed 2-3 transactions per second.

Another big issue is Bitcoin power consumption for mining. All Bitcoin mining in the world consumed more than 60 TWh electricity per year, that above Switzerland consumed a year (58 TWh).

Bitcoin blockchain charge fee for transactions around \$0.5-\$1 per transaction and it needs confirmation time around 10 minutes till 1 hour.

Since the third Bitcoin halving (May 2020), the average transaction fee is 3 USD per transaction, but it's go down to average 1 USD in June 2020.

With high fee on Bitcoin network, it is not compatible for microtransaction.

Bitcoin Sky

Bitcoin Sky (BSKY) was created to resolve Bitcoin Core (BTC) issues. BSKY has 800+ TPS (transaction per second), which is 400 times more than Bitcoin Core TPS. With transaction fee less than a cent, BSKY is compatible for any transactions including microtransactions. Bitcoin Sky is eco friendly, it needs no power for mining.

BSKY token will distributed to community through airdrops, bounties or holders reward. As decentralized cryptocurrency, Bitcoin Sky will be driven by community.

Let's make our world greener and the Sky shines bright.

TOKEN SPECIFICATION

Name: Bitcoin Sky

Symbol: BSKY

Max supply: 21,000,000 BSKY

Decimals: 6

Contract address: TNZNJE9RXMAa3dn8Y3wPTQTR48ksMTwSa3

BSKY explorer:
